Effect of Existing Heart Disease on Average of Exercise Angina

DESCRIPTION:

Angina is a of chest pain caused by reduced blood flow to the heart .Angina is a symptom of coronary artery disease. Angina feels like squeezing, pressure, heaviness, tightness or pain in the chest.

angina is chest pain caused by reduced blood flow to the heart muscles. It's not usually life threatening, but it's a warning sign that you could be at risk of a heart attack or stroke. With treatment and healthy lifestyle changes, it's possible to control angina and reduce the risk of these more serious problems.

although angina is relatively common, it can still be hard to distinguish from other types of chest pain, such as the discomfort of indigestion. If you have unexplained chest pain, seek medical help right away
